Attachment B; Traffic Noise Model Input/Output Data

---

This technical noise memo summarizes the results of the noise analysis conducted for onsite uses of the 493 Eastmoor Avenue Project in Daly City, California.

## 1 Background

### 1.1 Project Description

The proposed project involves the construction of a 70,399-gross-square-foot, 85-foot-tall, seven-story, mixed-use apartment building and associated improvements. The building would contain 35 studio apartments, 36 one-bedroom apartments, and 1 two-bedroom apartment for a total of 72 dwelling units on floors 3 through 7, and 1,196 square feet of street-level retail/office space. Common amenity space for residents would include a 3,396-square-foot podium courtyard, 1,156-square-foot community room, 457-square-foot fitness room, 542-square-foot bike room, 542-square-foot reading room, and 450-square-foot laundry room. A total of 32 parking spaces would be provided in a second-floor parking garage, including two accessible spaces and four Level 2 electric vehicle (EV) charging stations and 28 Level 1 EV charging stations, as well as 10 bike parking spaces. Due to the project site's sloping topography from west to east, the parking garage would be the first building level on the western portion of the site.

The residential portion of the project would achieve Leadership in Energy and Environmental Design (LEED) for Homes Gold for residential construction. In addition to the EV charging stations, the building would have solar panels and is proposed to be all electric.

The proposed floor plans consist of the following:

- Level 1: Commercial space, lobby, transformer room

- Level 2: Parking garage, lobby, mail room
- Level 3: Residential units, podium courtyard, leasing office, community room
- Level 4: Residential units, fitness room
- Level 5: Residential units, bike room
- Level 6: Residential units, reading room
- Level 7: Residential units, laundry room

## 1.2 Noise Fundamentals and Terminology

Vibrations, traveling as waves through air from a source, exert a force perceived by the human ear as sound. Sound pressure level (referred to as sound level) is measured on a logarithmic scale in decibels (dB) that represent the fluctuation of air pressure above and below atmospheric pressure. Frequency, or pitch, is a physical characteristic of sound and is expressed in units of cycles per second or hertz (Hz). The normal frequency range of hearing for most people extends from about 20 to 20,000 Hz. The human ear is more sensitive to middle and high frequencies, especially when the noise levels are quieter. As noise levels get louder, the human ear starts to hear the frequency spectrum more evenly. To accommodate for this phenomenon, a weighting system to evaluate how loud a noise level is to a human was developed. The frequency weighting called “A” weighting is typically used for quieter noise levels, which de-emphasizes the low-frequency components of the sound in a manner similar to the response of a human ear. This A-weighted sound level is called the “noise level” and is referenced in units of dBA.

Because sound is measured on a logarithmic scale, a doubling of sound energy results in a 3 dBA increase in the noise level. Changes in a community noise level of less than 3 dB are not typically noticed by the human ear (Caltrans 2013). Changes from 3 to 5 dB may be noticed by some individuals who are extremely sensitive to changes in noise. A 5 dB increase is readily noticeable. The human ear perceives a 10 dB increase in sound level as a doubling of the sound level (i.e., 65 dBA sounds twice as loud as 55 dBA to a human ear).

An individual’s noise exposure occurs over a period of time; however, noise level is a measure of noise at a given instant in time. The equivalent continuous sound level ( $L_{eq}$ ), also referred to as the average sound level, is a single number representing the fluctuating sound level in A-weighted decibels (dBA) over a specified period of time. It is a sound-energy average of the fluctuating level and is equal to a constant unchanging sound of that dB level. Community noise sources vary continuously, being the product of many noise sources at various distances, all of which constitute a relatively stable background or ambient noise environment.

Noise levels are generally higher during the daytime and early evening when traffic (including airplanes), commercial, and industrial activity is the greatest. However, noise sources experienced during nighttime hours when background levels are generally lower can be potentially more conspicuous and irritating to the receiver. In order to evaluate noise in a way that considers periodic fluctuations experienced throughout the day and night, a concept termed “community noise equivalent level” (CNEL) was developed. The CNEL

scale represents a time-weighted 24-hour average noise level based on the A-weighted sound level. CNEL accounts for the increased noise sensitivity during the evening hours (7 p.m. to 10 p.m.) and nighttime hours (10 p.m. to 7 a.m.) by adding 5 dB to the average sound levels occurring during the evening hours and 10 dB to the sound levels occurring during nighttime hours. Additional noise definitions are provided below.

**Ambient Noise Level.** The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.

**A-Weighted Sound Level (dBA).** The sound pressure level in decibels as measured on a sound level meter using the A-weighted filter network. The A-weighting filter deemphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with community equivalent sound level.

**Community Noise Equivalent Level (CNEL).** CNEL is the A-weighted equivalent continuous sound exposure level for a 24-hour period with a 10 dB adjustment added to sound levels occurring during the nighttime hours (10 p.m.–7 a.m.) and 5 dB added to the sound during the evening hours (7 p.m.–10 p.m.).

**Day Night Average Sound Level (DNL or  $L_{dn}$ ).** Similar to the CNEL noise metric, except that no penalty is added during the evening hours (7 p.m.–10 p.m.). Typically, the CNEL and  $L_{dn}$  noise metrics vary by approximately 1 decibel or less and are often considered to be functionally equivalent.

**Decibel (dB).** The decibel is a unit for measuring sound pressure level and is equal to 10 times the logarithm to the base 10 of the ratio of the measured sound pressure squared to a reference pressure, which is 20 micropascals.

## 2 Noise Analysis Methodology

### 2.1 Applicable Noise Standards

Because the proposed project may receive funding from the U.S. Department of Housing and Urban Development (HUD), the noise standards specified by HUD were used for this analysis. HUD's noise standards may be found in 24 CFR Part 51, Subpart B (CFR 2013). Exterior uses with a day night average sound level (DNL) of 65 dBA or less are considered normally acceptable. Sites at which the environmental or community noise exposure exceeds 65 decibels DNL are considered noise-impacted areas. For new construction proposed in high noise areas, grantees shall incorporate noise attenuation features to the extent required by HUD environmental criteria and standards contained in Subpart B (Noise Abatement and Control) of 24 CFR Part 51.

The "Normally Unacceptable" noise zone includes community noise levels from above 65 decibels to 75 decibels. Approvals in this noise zone require a minimum of 5 dB additional sound attenuation for buildings having noise-sensitive uses if the day-night average sound level is greater than 65 dBA but does not exceed 70 dBA, or a minimum of 10 decibels of additional sound attenuation if the day-night average sound level is greater than 70 dBA but does not exceed 75 dBA.

The interior noise standard is 45 dBA DNL.

## 2.2 Preliminary Traffic Noise Modeling

The primary noise source in the project vicinity is motor vehicle traffic. The eastern and southern façades of the proposed residential units would face Sullivan Avenue and Eastmore Avenue, respectively and beyond that, the I-280 freeway. Additionally, Junipero Serra Boulevard exists to the east of I-280 and further to the east are the light-rail lines of the Bay Area Rapid Transit (BART) system and Colma BART station. It should be noted however that the I-280 freeway is well below grade relative to the project site and the BART rail lines are approximately 1,300 feet away and are also below grade. The nearest airport, San Francisco International Airport (SFO), is located approximately 5.8 miles away. Based upon SFO's Comprehensive Airport Land Use Compatibility Plan (Ricondo & Associates 2012), the project site is located approximately 1 mile north of the airport's 60 dB CNEL noise contour. Thus, noise from the airport would have a negligible contribution to the on-site noise environment.

An initial noise analysis of traffic noise from I-280 carried out using HUD's DNL Calculator<sup>1</sup> indicated that worst-case exterior building façade noise levels would be substantially higher than the "normally acceptable" HUD standard of 65 dBA DNL. However, because the DNL Calculator does not account for site conditions such as elevated receivers and differences in roadway elevations (the I-280 is below grade relative to the proposed project site), a more detailed traffic noise model was used (please see Section 2.4).

## 2.3 Rail Noise Modeling

The HUD DNL Calculator was also used to estimate the noise levels from the BART light-rail lines, located approximately 1,300 feet away from the project site. The online weekday train schedules from BART for the four lines (the Red, Blue, Green and Yellow train lines) running through the Colma station were examined to obtain counts of daytime and nighttime train arrivals and departures. The input and output from the rail line analysis is provided in Attachment A. As shown in Attachment A, the resultant level at the nearest (easternmost) façade of the proposed project would be 51 dBA DNL, which would be well below the HUD noise standard for "normally acceptable" of 65 dBA DNL or less.

## 2.4 Detailed Traffic Noise Modeling

The proposed project site has several receiver locations of interest including multiple building exposures (i.e., rooms with exterior windows and balcony doors facing east and south) with varying traffic noise exposures as well as a common use outdoor amenities area located (the podium-level courtyard) which is surrounded on all four sides by the proposed building. Because of these factors, it was determined that the Federal Highway Administration's (FHWA) Traffic Noise Model (TNM) version 2.5 (FHWA 2004) would be ideal for a more detailed analysis. The TNM traffic noise prediction model calculates the noise levels based on specific information including traffic volumes, vehicle fleet mix, speed limits, roadway geometrics,

---

<sup>1</sup> <https://www.hudexchange.info/programs/environmental-review/dnl-calculator/>

receiver elevations, intervening structures and lateral distances between the noise receivers and the roadways.

Project site, surrounding structures and roadway geometry were input using aerial photography information upon which the project's site plan was overlain; this was subsequently digitized into the TNM model.

Modeled receiver locations (shown in Figure 2) consisted of the following:

- Proposed building façade exteriors with windows and doors facing Sullivan Avenue, Eastmore Avenue, the northbound and southbound lanes of the I-280 freeway, and Junipero Serra Boulevard (R1 through R3);
- Proposed common use outdoor area within the courtyard created by the 4-sided design of the proposed building (R4).

In order to accurately estimate the project site's noise levels in terms of the 24-hour weighted DNL noise metric, the TNM model was run for three 1-hour traffic volume cases: AM/PM peak-hour (assumed to be approximately 10% of the roadways' Average Daily Traffic (ADT); off-peak daytime (assumed to be approximately 6% of ADT), and nighttime volumes (assumed to be approximately 15 % of ADT over the 9-hour period from 10 PM to 7 AM, per HUD noise modeling guidance) The 15% of ADT was then divided by 9, to arrive at the hourly average level suitable for input into TNM. The resultant traffic noise levels for each of these cases was then averaged in the energy (i.e., the logarithmic) domain after applying the 10-decibel noise "penalty" to the nighttime noise levels.

Traffic volumes on the nearby arterial roadways were derived from the Final Traffic Impact Study Report prepared for the proposed project (TJKM 2020). The most recent traffic volume forecast available (Year 2020) were used as the basis to estimate future traffic volumes (10 years out from the Year 2026, the assumed year of occupancy). This was accomplished using an assumed increase rate of 1% per year. Thus, for example, the Year 2020 forecast average daily traffic volume of 13,250 for Sullivan Avenue north of Eastmore Avenue was calculated to be 14,930 by Year 2036. Similarly, the annual average ADT for I-280 for Year 2020 was obtained from the Caltrans Traffic Operations Census Website (Caltrans 2022) and projected to Year 2036 in a similar manner. The modeled ADTs are shown in Table 1 below. Modeled traffic speeds were used based upon the posted roadway speed limits using Google Earth Street View.

Table 1 – Modeled Traffic Volumes	
Modeled Roadway	Average Daily Traffic (ADT) Volume (Year 2036)
Sullivan Avenue north of Eastmore Avenue	14,930

Sullivan Avenue south of Eastmore Avenue	14,018
Eastmore Avenue west of Sullivan Avenue	11,595
San Pedro Avenue east of Sullivan Avenue	11,899
Junipero Serra Blvd north of San Pedro Avenue	14,795
Junipero Serra Blvd south of San Pedro Avenue	23,066
San Pedro Avenue west of Junipero Serra Blvd	12,012
San Pedro Avenue east of Junipero Serra Blvd	16,001
Sullivan Avenue north of Pierce Street	7,955
Pierce Street west of Sullivan Avenue	3,775
I-280 offramp east of Sullivan Avenue	14,750
I-280 Northbound	92,634
I-280 Southbound	92,634

Source: TJKM (except I-280 volumes), Caltrans (I-280 volumes), adjusted to Year 2036.

## 4 Noise Analysis Results

The results of the traffic noise analysis for the modeled on-site receivers (shown in Figure 2) are summarized in Table 2. The modeled input and output data are provided in Attachment B. As shown in Table 2, the highest noise levels would occur at Receivers R1 and R2, which is representative of the exterior facades of the habitable rooms facing east and southeast, and closest to the I-280 freeway (the major source of traffic noise in the project area). At Receiver R1, the traffic noise levels at the building façade are predicted to range from 71 dBA DNL at the 3<sup>rd</sup>-floor (the lowest occupied floor level) to 74.9 dBA DNL at the 7<sup>th</sup>-floor. Exterior traffic noise levels would be lower at receivers R2 and R3 but would still exceed the HUD “normally acceptable” standard of 65 dBA DNL except for the 3<sup>rd</sup>-floor level R3 receiver. Thus, the exposure from traffic noise along the eastern, southeastern and southern building facades would exceed the HUD exterior noise standard of 65 dBA DNL by up to 9.9 dB, putting these receivers in the “normally unacceptable” noise range. At the common outdoor use area (represented by Receiver R4), the traffic noise levels would not exceed 65 dBA DNL and thus would be well within the “normally acceptable” noise range.

Table 2 – Traffic Noise Level Results Summary (DNL (dBA))					
Receiver #	3rd-Floor	4th-Floor	5th-Floor	6th-Floor	7th-Floor
R1- Easterly Exposure	<b>71.0</b>	<b>72.9</b>	<b>74.3</b>	<b>74.7</b>	<b>74.9</b>
R2 - Southeasterly Exposure	<b>69.4</b>	<b>71.4</b>	<b>72.7</b>	<b>74.7</b>	<b>74.9</b>
R3 - Southerly Exposure	65	<b>65.4</b>	<b>66.4</b>	<b>68.4</b>	<b>68.9</b>
R4 - Podium Courtyard	43.2	n/a	n/a	n/a	n/a

Source: Attachment B.

Note: **Bolded** numbers indicate that the noise levels exceed the HUD noise standard of 65 dBA DNL.

Table 3 provides the combined traffic noise plus BART light rail noise levels. As shown, the additional noise contribution from the light rail noise source is (for the most part) negligible because traffic noise is by far the dominant noise source. However, with the incremental increase in noise levels the 3<sup>rd</sup>-floor noise level at receiver R3 (south side of the project site, adjacent to Eastmore Avenue) is also predicted to exceed the HUD noise standard of 65 dBA DNL.

Table 3 – Traffic Noise plus BART Rail Noise Level Results Summary (DNL (dBA))					
Receiver #	3rd-Floor	4th-Floor	5th-Floor	6th-Floor	7th-Floor
R1- Easterly Exposure	<b>71.0</b>	<b>72.9</b>	<b>74.3</b>	<b>74.7</b>	<b>74.9</b>
R2 - Southeasterly Exposure	<b>69.5</b>	<b>71.4</b>	<b>72.7</b>	<b>74.7</b>	<b>74.9</b>
R3 - Southerly Exposure	<b>65.2</b>	<b>65.6</b>	<b>66.5</b>	<b>68.5</b>	<b>69.0</b>
Podium Courtyard	43.2	n/a	n/a	n/a	n/a

Source: Attachments A and B.

Note: **Bolded** numbers indicate that the noise levels exceed the HUD noise standard of 65 dBA DNL.

As detailed in Section 2.1, 24 CFR Part 51, Subpart B states that sites at which environmental or community noise exposure exceeds the day night average sound level (DNL) of 65 dBA are considered to be noise-impacted. For new construction proposed in high noise areas, grantees shall incorporate noise attenuation features to the extent required. Approvals in the “normally unacceptable” noise zone require a minimum of 5 dB additional sound attenuation for buildings having noise-sensitive uses if the day-night average sound level is greater than 65 dBA but does not exceed 70 dBA, or a minimum of 10 decibels of additional sound attenuation if the day-night average sound level is greater than 70 dBA but does not exceed 75 dBA..

Typical new construction of multi-family homes with windows closed provides a minimum of 25 dB exterior to interior noise reduction. All residential units will be equipped with a forced air heating ventilation air conditioning (HVAC) unit that allows for a “windows closed” condition (i.e., windows do not need to be left open for ventilation). As such, the interiors of the proposed habitable rooms with doors or windows facing east and southeast are anticipated to have maximum noise levels of approximately 50 dBA DNL (i.e. 75 dBA exterior – 25 dBA attenuation = 50 dBA interior). The interiors of the proposed habitable rooms facing south are anticipated to have maximum noise levels of approximately 44 dBA DNL (i.e. 69 dBA exterior – 25 dBA attenuation = 44 dBA interior) or less. Nonetheless, In order to ensure compliance with 24 CFR Part

51, Subpart B and that the HUD noise standard of 45 dBA DNL is not exceeded, the detailed architectural design plans (when these are prepared) shall provide the following specification for upgraded windows:

- All windows and doors in the east and southeast-facing residential units (i.e., the residential units with doors or windows facing I-280) shall have a Sound Transmission Class (STC) rating of 35 or greater.
- All windows and doors in the south-facing residential units (i.e., the residential units with doors or windows with an oblique view of I-280) shall have a Sound Transmission Class (STC) rating of 30 or greater.

Please see Table 4. With implementation of this requirement the proposed project would not exceed the HUD interior noise standard of 45 dBA DNL and would be within the “normally acceptable” noise range for interior noise.

Table 4. Interior Noise Levels (DNL (dBA))						
Receivers / Location	Maximum Noise Level at Façade <sup>1</sup>	Required Interior Noise Reduction <sup>2</sup>	Minimum Anticipated Interior Noise Reduction <sup>3</sup>	Upgraded Windows /Doors? <sup>4</sup>	Interior Noise Level <sup>5</sup>	Exceedance of Interior Noise Standard?
R1- Easterly Exposure	75	30	33	Yes	42	No
R2 - Southeasterly Exposure	75	30	33	Yes	42	No
R3 - Southerly Exposure	69	24	28	Yes	41	No
Podium Courtyard	n/a	n/a	n/a	n/a	n/a	n/a

1 - Estimated exterior noise level at the building façade based upon Table 3.

2 - Noise reduction required to satisfy the interior noise standards.

3 - Minimum interior noise reduction with windows closed and upgraded windows for east, southeast and south-facing units.

4 - Does the required interior noise reduction trigger upgraded windows with an STC greater than 27?

5 - Estimated noise level based upon minimum anticipated noise reduction.

## Rail Noise Model Input/Output Data

[Home \(/\)](#) > [Programs \(/programs/\)](#) > [Environmental Review \(/programs/environmental-review/\)](#) > DNL Calculator

## DNL Calculator

The Day/Night Noise Level Calculator is an electronic assessment tool that calculates the Day/Night Noise Level (DNL) from roadway and railway traffic. For more information on using the DNL calculator, view the [Day/Night Noise Level Calculator Electronic Assessment Tool Overview \(/programs/environmental-review/daynight-noise-level-electronic-assessment-tool/\)](#).

## Guidelines

- To display the Road and/or Rail DNL calculator(s), click on the "Add Road Source" and/or "Add Rail Source" button(s) below.
- All Road and Rail input values must be positive non-decimal numbers.
- All Road and/or Rail DNL value(s) must be calculated separately before calculating the Site DNL.
- All checkboxes that apply must be checked for vehicles and trains in the tables' headers.
- **Note #1:** Tooltips, containing field specific information, have been added in this tool and may be accessed by hovering over all the respective data fields (site identification, roadway and railway assessment, DNL calculation results, roadway and railway input variables) with the mouse.
- **Note #2:** DNL Calculator assumes roadway data is always entered.

## Mitigation Options

If your site DNL is in Excess of 65 decibels, your options are:

- **No Action Alternative:** Cancel the project at this location

- **Other Reasonable Alternatives:** Choose an alternate site
- **Mitigation**
  - Contact your Field or Regional Environmental Officer (</programs/environmental-review/hud-environmental-staff-contacts/>)
  - Increase mitigation in the building walls (only effective if no outdoor, noise sensitive areas)
  - Reconfigure the site plan to increase the distance between the noise source and noise-sensitive uses
  - Incorporate natural or man-made barriers. See *The Noise Guidebook* (</resource/313/hud-noise-guidebook/>)
  - Construct noise barrier. See the Barrier Performance Module (</programs/environmental-review/bpm-calculator/>)

## Tools and Guidance

Day/Night Noise Level Assessment Tool User Guide (</resource/3822/day-night-noise-level-assessment-tool-user-guide/>)
